

### *Control Solutions' Babel Buster BB2-7010*

is a BACnet IP client/server device that functions as a Modbus RTU master/slave and/or Modbus TCP client/server. A large number of BACnet objects gives you flexibility in mapping Modbus registers to any combination of BACnet objects. Packed Modbus registers may be parsed to multiple BACnet objects when reading. Multiple BACnet objects may be packed into a single Modbus register when writing. All standard Modbus register types are supported.

Value objects will poll their assigned Modbus register at the interval you specify. The content of the Modbus register will be given as the Present Value of the BACnet object when read. The Modbus register is written each time the BACnet Value object is written. The Value object corresponds well the the Modbus Holding register.

Input objects will poll their assigned Modbus register at the interval you specify, and provide the Modbus data as the Present Value when read. Commandable Output objects are used to write Modbus registers, and will update the Modbus device each time BACnet is updated.

The BB2-7010-01 can be Modbus RTU master or slave, is concurrent Modbus TCP client and server, and is concurrent BACnet IP client and server. The BB2-7010-02 adds SNMP client and server. Read/write data from any of these protocols to another via BACnet objects retained in the local database of the BB2-7010. The BB2-7010-06 includes support for WiFi sensors.
